

The ERMS project can be divided into roughly 6 broad categories:

- 1) The modifications to UCIS
- 2) The creation of the Filenet repository
- 3) The creation of the processes to add index info to documents as they are added to UCIS
- 4) The creation of workflows within Filenet
- 5) The creation of the processes for scanning and adding documents to Filenet
- 6) Processes for working with documents within Filenet

Currently, numbers 1, 2, 3, and 4 are essentially functional. (Further testing is needed, however). Items 5 and 6 are non-functional or function with problems.
